

A photograph of sunlight streaming through the leaves of trees, creating a bright, hazy atmosphere. The sun is positioned on the left side, with rays of light fanning out across the scene. The background is a clear blue sky with some light clouds.

# LIFE IN SYNTROPY

Through much observation and practice, the Swiss-Brazilian Ernst Gotsch has developed a synergistic (syntropic) way of producing abundant crops, while regenerating the land and the human spirit, bringing dignity and economic benefits to thousands of families in Brazil and across the globe.

Syntropic farming is about working with nature's laws and ethics, in a cooperative way, where plants, animals and humans are valued for their intrinsic capacities and relationships. Following principles of natural succession (time) and stratification (space), annual and perennial plants are managed harmoniously, and as the system evolves, it naturally renders itself free from external inputs and irrigation, while productivity, joy and freedom continue to increase.

In Australia, Syntropic Farming has only been introduced in August 2016, at Chillingham, NSW (Gabalah Farm), but it is quickly spreading to all states and climates with great potential both commercially and domestically.

Come and join us for the screening of Life in Syntropy (15min documentary) followed by a lively chat on syntropic principles and practices as well as Q&A.
